MFSH-44 Horizontal Flow Splitter

Material: Rotationally Molded Polyethylene

The MFSH-44 Horizontal Flow Splitter Module splits a single effluent flow exiting a kitchen into two separate, equal flows in large institutional-type installations or for sites that need central grease removal but have a small footprint. The kitchen flows are diverted into twin Trapzilla Units installed horizontally beside one another. For example, couple two TZ-600 150 GPM units together to pretreat a single 300 GPM flow from a kitchen. The MFSH-44 has a 4" Inlet Coupling and splits off into two 4" Outlet Couplings.
